

Election indices

The figures below represent the values of three indices:

- (i) the least squares index (LSq), which measures disproportionality between the distributions of votes and of seats;
- (ii) the effective number of parties at the electoral level ($\text{Eff } N_v$, also termed ENEP);
- (iii) the effective number of parties at the parliamentary or legislative level ($\text{Eff } N_s$, also termed ENPP).

The N of seats refers to the number given in the sources used and is the number on which the calculations were based (though see point (i) below).

These indices were originally outlined in Markku Laakso and Rein Taagepera, ‘“Effective” number of parties: a measure with application to west Europe’, *Comparative Political Studies* 12:1 (1979), pp. 3–27 (effective number of parties), and Michael Gallagher, ‘Proportionality, disproportionality and electoral systems’, *Electoral Studies* 10:1 (1991), pp. 33–51 (least squares index).

Details of these indices, and of how they have been calculated, can be found in Appendix B of:

Michael Gallagher and Paul Mitchell (eds), *The Politics of Electoral Systems* paperback edition (Oxford and New York: Oxford University Press, 2008).

For further details on this book, see :

<http://www.oup.com/uk/catalogue/?ci=9780199238675>

The main sources for the election results from which these indices are calculated are:

Thomas T. Mackie and Richard Rose, *The International Almanac of Electoral History*, 3rd ed (Basingstoke: Macmillan, 1991);

Annual Data Section in *European Journal of Political Research* since 1990;

Richard Rose and Neil Munro, *Elections and Parties in New European Democracies* (Washington: CQ Press, 2003);

Dieter Nohlen, Michael Krennerich and Bernhard Thibaut (eds), *Elections in Africa: a data handbook* (Oxford: Oxford University Press, 1999);

Dieter Nohlen, Florian Grotz and Christof Hartmann (eds), *Elections in Asia and the Pacific: a data handbook*, 2 vols (Oxford: Oxford University Press, 2001);

Dieter Nohlen (ed.), *Elections in the Americas: a data handbook*, 2 vols (Oxford: Oxford University Press, 2005);

and, for recent elections in particular, a range of internet sites, where possible official ones, a list of which is given in Appendix E of Gallagher and Mitchell (eds), *The Politics of Electoral Systems*. An additional and very useful site, not listed there, is the African Elections Database at

<http://africanelections.tripod.com/>

While any user of these sources must appreciate the time that has been spent in compiling them and the care taken to ensure accuracy, the main problems associated with sources (and, implicitly, the main appeals to those who compile election results) are:

(i) occasional logical inconsistency, i.e. the number of votes or seats for the listed parties does not add to the stated total, or a party with no votes is stated to have won seats. A list of corrections that need to be made to the Mackie and Rose figures can be found in Arend Lijphart, *Electoral Systems and Party Systems: A Study of Twenty-Seven Democracies, 1945–1990* (Oxford and New York: Oxford University Press, 1994), pp. 163–77. Generally, the approach adopted here has been the same as Lijphart's, i.e. when the reported number of total valid votes (or seats) does not equal the sum of the reported votes (or seats) for individual parties, the number used as the basis for calculations has been the sum of the parties' votes (or seats).

(ii) bunching of 'Others', i.e. small parties and independents not listed separately. In the calculation of indices, the greater the amount of disaggregation in the data, the better. Ideally, every party winning more than 0.1 per cent of the national vote, certainly 0.5 per cent, should be listed separately. The votes of Independents are very rarely disaggregated, so when they are a significant force (Japan, South Korea), there are problems in trying to compute indices given that each independent candidate should be treated as a separate 'party'. The approach taken here has been that outlined in Appendix B of Gallagher and Mitchell (eds), *The Politics of Electoral Systems* – except in the case of the figures for a few countries, such as Ireland, which are based on perfect data, i.e. on complete disaggregation down to the level of each individual independent candidate.

(iii) very occasionally, the problem is the opposite of (ii), namely that results exist only in disaggregated form that no-one has yet taken the trouble to aggregate (or to make the figures generally available if they have been aggregated), as with Argentina or the constituency-level votes in Lithuania in 2004 and 2008. In Argentina, the different parties (or party names) and alliances in different provinces make it very difficult to identify reliable national-level vote figures.

An issue that arises occasionally under mixed systems (those where some candidates are elected from small constituencies and others from a national or regional list) is that some constituency seats are won by independent candidates or small parties that do not run in the list element of the election. (Examples include Egypt, Morocco, Palestine.) When only list vote totals are available, or when list votes alone are the basis for allocating seats to parties, this creates a situation where it appears, comparing national votes with seats, that somehow a party that won no votes nonetheless won a seat. Anomalous as this is, it seems preferable to simply ignoring these candidates / parties and basing the calculations on the other seats, which would distort every other party's percentage of the seats.

The countries included here include the standard set that tend to feature in comparative politics analyses and, relatedly of course, are covered in the sources listed above. As many other countries as possible are also included for particular elections, dependent on the availability of reliable and adequately disaggregated results. The elections included are confined to those that could plausibly be deemed occasions of choice for the voting population, which is not to imply that every single election included here can be regarded as meeting the highest democratic standards.

A complication that affects the calculation of Eff N_s in a few cases is that groups of parties may contest an election as a coalition in order to reap the benefits of size and then disaggregate after the election. For example, in Greece's 1958 election only five groupings contested the election and have recorded vote totals, but because two of these groupings were umbrellas, seat totals are recorded for nine different parties (Mackie and Rose, *International Almanac*, pp. 198–200). In the figures below, Eff N_s is based on seat totals for the same groups as are used for the calculation of Eff N_v , disregarding any post-election splitting of the groupings that contested the election together.

Conditions of use: there aren't any, but citations are always appreciated ...

Notes

Albania

First two measures based on list votes. The highly disproportional outcome in 2005 results from the (deliberately) low list vote won by the two parties that together won virtually all of the SMD seats, thus, through manipulation of the system, converting the mixed compensatory electoral system into in effect a mixed parallel system. The electoral system was changed to a PR list system, with 12 regional constituencies, prior to the 2009 election.

Argentina

Aggregated figures from elections more recent than 2005 are unavailable, and would be difficult if not impossible to compile given that parties formed different alliances in different constituencies.

Australia

2010 figures based on treating the Liberal Party, the Nationals, and the Liberal National Party of Queensland, as three separate parties. If instead they were treated collectively as one party the values would be LSq 11.37, N_v 2.89, N_s 2.14.

Bosnia and Hercegovina

All figures are given at the level of BiH as a whole, though in practice the two 'entities' (the Federation and Republika Srpska) have virtually separate party systems.

No source gives entirely satisfactory results for the 2002 election, with excessive bunching of 'others' and discrepancies between sources, though with 'perfect' information the difference to the indices would almost certainly be at most marginal.

Croatia

For 2011, the pattern whereby different alliances of parties contest different constituencies makes calculation of indices slightly problematic, but is likely to affect the figures only marginally. The figures for 2011 include the 8 'minority seats', apart from the one (in the Tajik constituency) where there was only one candidate. If these were excluded and figures were based on only the ten geographical constituencies plus the constituency for Croatians abroad, the figures would be LSq 12.40, N_v 5.01, N_s 2.70, with an N of 143 seats.

Egypt

2011 figures are based on votes cast for the PR seats (332 of them) but refer to total seats. There were 498 seats in all, the other 166 being filled from single-member constituencies. Of the single-member seats, 21 were won by independents, who did not contest the PR seats; if they were excluded the values of the indices would change only marginally (N_s would remain unaltered at 3.38). Calculation of indices is complicated by the fact that several of the largest 'parties' were in fact alliances of a number of different parties, for which separate figures are not available.

France

Figures are based on first-round votes. The figures for N_v and N_s are probably slight under-estimates because of the habit in both official and unofficial sources of lumping independent and very minor parties together as ‘divers droit’ and ‘divers gauche’, rather than reporting vote and seat totals separately for each micro-group.

Germany

The figure in the effective number of legislative parties (N_s) column is based on treating the CDU and CSU as separate parties. However, the CDU and CSU, even though they stand separately at the election (and therefore seats are awarded to them on the basis of the vote totals for each party) form a single parliamentary party (*Fraktion*), and treating them as just one party at parliamentary level produces the following N_s figures:

1949	4.01
1953	2.79
1957	2.39
1961	2.51
1965	2.38
1969	2.24
1972	2.34
1976	2.31
1980	2.44
1983	2.51
1987	2.80
1990	2.65
1994	2.91
1998	2.91
2002	2.80
2005	3.44
2009	3.97

Gibraltar

The figures for 2011 are based on treating the Gibraltar Socialist Labour Party and the Liberal Party as separate parties. If they are treated as one unit (they ran in alliance), the figures would be LSq 8.64, N_v 2.18, N_s 1.94.

Guyana

2006 and 2011 figures based on national PR-list votes and total seats.

Honduras

1980 figures refer to the election of a Constitutional Assembly.

Hungary

176 seats are filled in single-member constituencies (districts) and 152 are filled in multi-member constituencies (districts). In addition, a further 58 seats are filled from national lists, based on votes not ‘used’ at the other two levels, which is why the seat totals for SMDs and lists do not add to the overall total.

Iraq

Available figures for Iraq's 2010 election suggest that the 8 seats reserved for Christians and for 'minorities' were not filled through the regular election process.

Ireland

N seats refers to contested seats only. The outgoing Ceann Comhairle (chairperson of the Dáil, or speaker) is automatically re-elected without contest, and has availed himself (no female holders of the office yet) of this option at every election bar that of 1997.

Italy

In 1994, 1996 and 2001 the number of list seats was 155.

Japan

Overall figures from 1996 onwards based on total votes (sum of list and SMD votes) and total seats.

Korea South

No detailed constituency figures are available for the 2008 election.

Kosova (/Kosovo)

Figures exclude the 20 'minority' seats. These are reserved for parties representing particular ethnic groups (10 for Serbs, 10 for four other ethnic groups) regardless of how many votes the parties win. Sometimes these parties also win sufficient votes to be awarded one or more of the 100 regular seats, but usually they win very few votes – for example, in 2010 8 reserved seats were won by parties that won fewer than 0.5 per cent of the national vote each. If those were included, the value of N_v would hardly alter because their votes are so little different from zero, while the value of N_s rises: to 4.15 in 2001, 4.31 in 2004, 5.90 in 2007, 6.03 in 2010. The value of LS_q would also rise, not surprisingly, given that a sixth of the seats (20 out of 120) are being taken by parties with close to no votes: in 2010 from 3.33 to 5.65. This is better regarded as an artefact of the minority representation aspect of Kosova's electoral law than as an electoral system effect.

Lesotho

Disproportionality and vote-fragmentation figures for 2007 are difficult to calculate meaningfully because of successful manipulation by the main parties of the mixed compensatory electoral system: the parties that won virtually all of the constituency seats did not run at all in the PR-list section of the election, thus freeing up their supporters to vote for allied parties, which duly won most of the list seats. This in effect converted the mixed compensatory electoral system into a mixed parallel system, as in Albania in 2005.

Lithuania

For 1992–2000 results, based on total votes (sum of list votes and SMD votes) and total seats, which is how the indices should be calculated given that Lithuania uses a mixed parallel electoral system. For 2004 and 2008, though, asterisked figures calculated on the basis of list (regional) votes and total seats, because figures for SMD results are not available.

The detailed 2008 constituency results are available on the web at http://www.vrk.lt/2008_seimo_rinkimai/output_en/rezultatai_vienmand_apygardose/rezultatai_vienmand_apygardose1turas.html but not in aggregated form.

Macedonia

1998–2006: on the basis of PR-list votes and total seats. The 2011 election took place under a single-tiered list system.

Monaco

Since 2002, Monaco has used a parallel mixed system to fill its 24 seats. Sixteen seats are filled by the block vote (known in the USA as ‘at-large’), the method well known to be likely to produce less proportional results than those produced by any other electoral system; the largest party usually wins all of these seats. (Prior to 2002 all the seats were filled at-large, using the two-round method.) The other eight seats are filled by proportional representation, but because the system is mixed parallel rather than mixed compensatory the largest party wins most of these seats as well. As a result, Monégasque elections consistently produce exceptionally high levels of disproportionality.

Morocco

These figures come with caveats. In all, 396 MPs were elected, and the figures here are based on total seats but on the votes cast for only 90 of these (the 90 elected from the national list constituency, confined to female and youthful candidates – the ‘Listes nationales femmes et jeunes’). The other 306 MPs were elected from 92 multi-member constituencies, and figures are not available for these. Moreover, 5 seats were won in the constituencies by parties that did not stand in the national constituency (the PRE won 2 seats and the AHD / PAD, the PRE and the PUD 1 each) and no vote figures are available for these parties. (Excluding them from the result and basing the calculations only on the other 391 seats would make only minor differences to the indices; LS_q would rise to 5.46, N_v would remain at 8.82, N_s would drop to 6.54.)

Northern Ireland

Figures for 1945–65 include uncontested seats won. Figures for 1945–62 include votes cast in University seats.

Figures for 1969 and 1973 need to be treated with some caution, since the largest party was fundamentally split, with pro- and anti-leadership candidates, alongside a number of independent candidates who were de facto supporters of the leadership. Figures are presented here for the groupings reported in Sydney Elliott, *Northern Ireland Parliamentary Election Results 1921–72* (Chichester: Political Reference Publications, 1973), and Ian McAllister, *The 1975 Northern Ireland Convention Election* (Glasgow: Survey Research Centre, University of Strathclyde, 1975), p. 15.

Palestine

Figures for LS_q and N_v are based on list votes only. Votes in the multi-member constituencies are difficult to calculate, even though full figures are available, because the ‘block vote’ (the least proportional electoral system known to humanity) is used, with each voter having as many votes to cast as there are seats to fill.

A further complication is that in 2006 4 constituency seats were won by nominal Independents (albeit with, it seems, tacit Hamas support), and of course these candidates did not win any list votes. The figures are based on treating these candidates as if they each won 0 votes and 1 seat. That is not entirely satisfactory but is less unsatisfactory than the alternative of simply ignoring them and basing all calculations on the other 128 seats (which would give LS_q 10.64, N_v 2.68, N_s 2.18).

St Vincent and the Grenadines

1998 figures based on results given in several sources that show a party (the ULP) winning a minority of the seats despite receiving 55 per cent of the votes while a party with 45 per cent of the votes (the NDP) won a majority of the seats. If the seat numbers have been attributed to the wrong parties in these sources, the correct value of LS_q would be 1.31; the other indices would remain unaltered.

San Marino

2008 figures calculated on the basis of parties as the units. In fact, the seven parties formed two coalitions (three parties in one and four in the other); treating the coalitions as the units, the figures would be LS_q 4.11, N_v 1.99, N_s 1.95.

Scotland

On the basis of list (regional) votes and total seats.

Thailand

On the basis of PR-list votes and total seats.

Tunisia

The 2004 election was not in any sense a genuinely democratic election and is included only as a comparator. Reliable figures are difficult to obtain for the competitive post-Arab spring 2011 election. The results used here, from tunisia-live.net, omit the 1.29 million votes (almost 32 per cent of the total) cast for parties or candidates who won no seats, for whom no figures are available. If (as is likely) these were cast overwhelmingly for parties that won small numbers of votes, their inclusion would be likely to increase the values of LS_q and N_v marginally; the value of N_s would not be altered.

Turkey

Figures for 2011 election are based on the assumption, as reported in various sources, that the ‘Independents’ who collectively won 6.57 per cent of the national vote were in effect all standing on behalf of the Kurdish BDP, adopting the tactic of standing as nominal independents in order to avoid the effects of the 10 per cent threshold in the electoral system, which parties, though not independents, need to reach in order to qualify for any seats.

United Kingdom

Figures for 1983 and for 1987 are calculated on the basis of treating the Liberal Party and the SDP as separate parties. The two parties fought the elections as an alliance and did not offer more than one candidate between them in any constituency. If the alliance is treated as a party in its own right, the figures for 1983 are LSq 20.58, N_v 3.12 and N_s 2.09; for 1987 they are LSq 17.75, N_v 3.07 and N_s 2.17.

Venezuela

2010 figures: omitting the three seats reserved for indigenous peoples.

Wales

On the basis of list (regional) votes and total seats.

Zambia

2006 figures are based on the results in 148 of the 150 constituencies. In the other two (numbers 94 and 104) polling was postponed, and the results do not appear in the official returns. The MMD won both seats and based on all 150 seats N_s is 2.84.

Polling in two constituencies was deferred in 2011 as well, but the results of these were made available on the web in due course.
